Summary: The glycoprotein encoded by this gene is a cell surface antigen that is expressed in greater

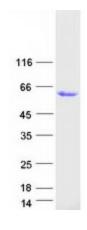

> than 95% of human colon cancers. The open reading frame encodes a 319-amino acid polypeptide having a putative secretory signal sequence and 3 potential glycosylation sites.

The predicted mature protein has a 213-amino acid extracellular region, a single transmembrane domain, and a 62-amino acid intracellular tail. The sequence of the extracellular region contains 2 domains characteristic of the CD2 subgroup of the

immunoglobulin (Ig) superfamily. [provided by RefSeq, Jul 2008]
