Summary:	The protein encoded by this gene is involved in the attachment of osteoclasts to the mineralized bone matrix. The encoded protein is secreted and binds hydroxyapatite with high affinity. The osteoclast vitronectin receptor is found in the cell membrane and may be involved in the binding to this protein. This protein is also a cytokine that upregulates expression of interferon-gamma and interleukin-12. Several transcript variants encoding different isoforms have been found for this gene. Protein Families	: Druggable Genome, Secreted Protein	
Protein Pathway	<i>is:</i> ECM-receptor interaction, Focal adhesion, Toll-like receptor signaling pathway
