Summary:	Tissue specific transplantation antigen P35B is a NADP(H)-binding protein. It catalyze the two- step epimerase and the reductase reactions in GDP-D-mannose metabolism, converting GDP- 4-keto-6-D-deoxymannose to GDP-L-fucose. GDP-L-fucose is the substrate of several fucosyltransferases involved in the expression of many glycoconjugates, including blood group ABH antigens and developmental adhesion antigens. Mutations in this gene may cause leukocyte adhesion deficiency, type II. [provided by RefSeq, Jul 2008]
Protein Families	: Druggable Genome
Protein Pathway	<i>is:</i> Amino sugar and nucleotide sugar metabolism, Fructose and mannose metabolism, Metabolic pathways
