Summary: The protein encoded by this gene is a member of the protein tyrosine phosphatase (PTP)

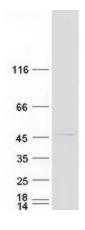

family. PTPs are known to be signaling molecules that regulate a variety of cellular processes including cell growth, differentiation, mitotic cycle, and oncogenic transformation. This PTP possesses an extracellular region, a single transmembrane region, and a single intracellular catalytic domain, and thus represents a receptor-type PTP. Silencing of this gene has been associated with colorectal cancer. Multiple transcript variants encoding different isoforms have been found for this gene. This gene shares a symbol (PTPRQ) with another gene, protein

tyrosine phosphatase, receptor type, Q (GenelD 374462), which is also located on chromosome 12. [provided by RefSeq, May 2011]

**Protein Families:** Druggable Genome, Phosphatase, Transmembrane

**Protein Pathways:** MAPK signaling pathway
