Summary: The protein encoded by this gene is a glycolytic enzyme that catalyzes the converse diphosphoglycerate to 3-phosphoglycerate. The encoded protein may also act as a polymerase alpha. Additionally, this protein is secreted by tumor cells where it para angiogenesis by functioning to reduce disulfide bonds in the serine protease, plass consequently leads to the release of the tumor blood vessel inhibitor angiostatin. protein has been identified as a moonlighting protein based on its ability to perform mechanistically distinct functions. Deficiency of the enzyme is associated with a w clinical phenotypes hemolytic anemia and neurological impairment. Pseudogeness have been defined on chromosomes 19, 21 and the X chromosome.
