Summary:	mary: This gene encodes a member of the cytochrome P450 superfamily of enzymes. The cytochrome P450 proteins are monooxygenases which catalyze many reactions involved in drug metabolism and synthesis of cholesterol, steroids and other lipids. This protein localizes to the mitochondria inner membrane and catalyzes the conversion of cholesterol to pregnenolone, the first and rate limiting step in the synthesis of the steroid hormones. Two transcript variants encoding differer isoforms have been found for this gene. The cellular location of the smaller isoform is unclear since it lacks the mitochondrial-targeting transit peptide. Protein Families:	Druggable Genome, P450	
Protein Pathway	C21-Steroid hormone metabolism, Metabolic pathways
