Summary: The protein encoded by this gene catalyzes the formation of acyl-CoA from fatty acids, ATP,

and CoA, using magnesium as a cofactor. The encoded protein plays a major role in fatty acid metabolism in the brain. Translocations with the ETV6 gene are causes of myelodysplastic syndrome with basophilia, acute myelogenous leukemia with eosinophilia, and acute

eosinophilic leukemia. Several transcript variants encoding different isoforms have been found

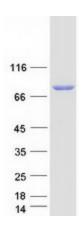

for this gene.[provided by RefSeq, Apr 2011]

Protein Families: Druggable Genome, Transmembrane

Protein Pathways: Adipocytokine signaling pathway, Fatty acid metabolism, Metabolic pathways, PPAR signaling

pathway
