Summary: The protein encoded by this gene is a G protein-coupled receptor and is a component of the

heterodimeric amino acid taste receptor T1R1+3. The T1R1+3 receptor responds to L-amino acids but not to D-enantiomers or other compounds. Most amino acids that are perceived as

sweet activate T1R1+3, and this activation is strictly dependent on an intact T1R1+3

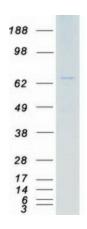

heterodimer. Multiple transcript variants encoding different isoforms have been found for this

gene. [provided by RefSeq, Jun 2010]
