**Summary:** The laminar organization of multiple neuronal types in the cerebral cortex is required for normal

cognitive function. In mice, the disabled-1 gene plays a central role in brain development, directing the migration of cortical neurons past previously formed neurons to reach their proper layer. This gene is similar to disabled-1, and the protein encoded by this gene is thought to be a signal transducer that interacts with protein kinase pathways to regulate neuronal positioning in

the developing brain. [provided by RefSeq, Jan 2017]
