Summary: The protein encoded by this gene acts as a homotetramer to regulate cell growth. The

encoded protein is an enzyme that catalyzes the synthesis of xanthine monophosphate (XMP) from inosine-5'-monophosphate (IMP). This is the rate-limiting step in the de novo synthesis of guanine nucleotides. Defects in this gene are a cause of retinitis pigmentosa type 10 (RP10).

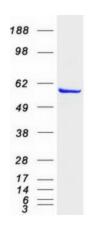

Several transcript variants encoding different isoforms have been found for this gene.
