Summary: This gene encodes the enzyme responsible for formation of the blood group I antigen. The i and

I antigens are distinguished by linear and branched poly-N-acetyllactosaminoglycans,

respectively. The encoded protein is the I-branching enzyme, a beta-1,6-N-

acetylglucosaminyltransferase responsible for the conversion of fetal i antigen to adult I antigen in erythrocytes during embryonic development. Mutations in this gene have been associated with adult i blood group phenotype. Alternatively spliced transcript variants encoding different

isoforms have been described. [provided by RefSeq, Jul 2008]
