	Endonuclease V (ENDOV) (NM_173627) Human Recombinant Protein – TP315740L
UniProt ID:	<u>Q8N8Q3</u>
RefSeq Size:	2858
Cytogenetics:	17q25.3
RefSeq ORF:	846
Summary:	Endoribonuclease that specifically cleaves inosine-containing RNAs: cleaves RNA at the second phosphodiester bond 3' to inosine. Has strong preference for single-stranded RNAs (ssRNAs) toward double-stranded RNAs (dsRNAs). Cleaves mRNAs and tRNAs containing inosine. Also able to cleave structure-specific dsRNA substrates containing the specific sites 5'-IIUI-3' and 5'- UIUU-3'. Inosine is present in a number of RNAs following editing; the function of inosine- specific endoribonuclease is still unclear: it could either play a regulatory role in edited RNAs, or be involved in antiviral response by removing the hyperedited long viral dsRNA genome that has undergone A-to-I editing. Binds branched DNA structures.[UniProtKB/Swiss-Prot Function]
