	RNPS1 (NM_080594) Human Recombinant Protein – TP315882L
UniProt ID:	<u>Q15287, D3DU92</u>
RefSeq Size:	2251
Cytogenetics:	16p13.3
RefSeq ORF:	915
Synonyms:	E5.1
Summary:	This gene encodes a protein that is part of a post-splicing multiprotein complex involved in both mRNA nuclear export and mRNA surveillance. mRNA surveillance detects exported mRNAs with truncated open reading frames and initiates nonsense-mediated mRNA decay (NMD). When translation ends upstream from the last exon-exon junction, this triggers NMD to degrade mRNAs containing premature stop codons. This protein binds to the mRNA and remains bound after nuclear export, acting as a nucleocytoplasmic shuttling protein. This protein contains many serine residues. Several transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Nov 2013]
