Summary: The protein encoded by this gene is a critical subunit of N-methyl-D-aspartate receptors,

members of the glutamate receptor channel superfamily which are heteromeric protein

complexes with multiple subunits arranged to form a ligand-gated ion channel. These subunits

play a key role in the plasticity of synapses, which is believed to underlie memory and

learning. Cell-specific factors are thought to control expression of different isoforms, possibly contributing to the functional diversity of the subunits. Alternatively spliced transcript variants

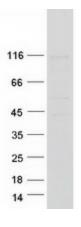

have been described. [provided by RefSeq, Jul 2008]
