Summary:	This gene encodes an aminotransferase that transaminates kynurenine to form kynurenic acid, which is a metabolite of tryptophan. Multiple alternatively spliced transcript variants that encode different proteins have been described for this gene. This gene shares 5' exon structure with the RNA binding motif protein, X-linked-like 1 locus on chromosome 1, but the coding sequences are non-overlapping. [provided by RefSeq, Mar 2017]

### Product images:

Coomassie blue staining of purified KYAT3 protein (Cat# [TP317351]). The protein was produced from HEK293T cells transfected with KYAT3 cDNA clone (Cat# [RC217351]) using MegaTran 2.0 (Cat# [TT210002]).
