**Summary:** This gene belongs to the chemokine-like factor gene superfamily, a novel family that is similar

> to the chemokine and transmembrane 4 superfamilies. This gene is one of several chemokinelike factor genes located in a cluster on chromosome 3. This gene acts as a tumor suppressor that regulates G1/S transition in the cell cycle, and epidermal growth factor receptor/protein

kinase B signaling during tumor pathogenesis. Alternative splicing results in multiple transcript variants encoding different isoforms. [provided by RefSeq, Feb 2016]
