#### HFE (NM\_139009) Human Recombinant Protein - TP319465

UniProt ID: Q30201
RefSeq Size: 1280
Cytogenetics: 6p22.2
RefSeq ORF: 975

**Synonyms:** HFE1; HH; HLA-H; MVCD7; TFQTL2

**Summary:** The protein encoded by this gene is a membrane protein that is similar to MHC class I-type

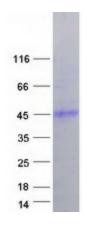

proteins and associates with beta2-microglobulin (beta2M). It is thought that this protein functions

to regulate iron absorption by regulating the interaction of the transferrin receptor with transferrin. The iron storage disorder, hereditary haemochromatosis, is a recessive genetic disorder that results from defects in this gene. At least nine alternatively spliced variants have been described for this gene. Additional variants have been found but their full-length nature has

not been determined. [provided by RefSeq, Jul 2008]

**Protein Families:** Druggable Genome, Transmembrane
