| Summary: | The protein encoded by this gene is a low affinity receptor for the Fc region of immunoglobulin gamma complexes. The encoded protein is involved in the phagocytosis of immune complexes and in the regulation of antibody production by B-cells. Variations in this gene may increase susceptibilty to systemic lupus erythematosus (SLE). Several transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Jun 2010] |
| Protein Families | : ES Cell Differentiation/IPS, Transmembrane |
| Protein Pathway | /s: B cell receptor signaling pathway, Fc gamma R-mediated phagocytosis, Systemic lupus erythematosus |
