| Summary: The protein encoded by this gene is a pleiotropic cytokine that functions as a chemoattr a modulator of T cell activation, and an inhibitor of HIV replication. The signaling proces this cytokine is mediated by CD4. The product of this gene undergoes proteolytic proces which is found to yield two functional proteins. The cytokine function is exclusively attril to the secreted C-terminal peptide, while the N-terminal product may play a role in cell of control. Caspase 3 is reported to be involved in the proteolytic processing of this protein Alternate splicing results in multiple transcript variants. [provided by RefSeq, Feb 2010] | | |
