Summary: The protein encoded by this gene is a trifunctional polypeptide. It has

phosphoribosylglycinamide formyltransferase, phosphoribosylglycinamide synthetase, phosphoribosylaminoimidazole synthetase activity which is required for de novo purine biosynthesis. This enzyme is highly conserved in vertebrates. Alternative splicing of this gene results in two transcript variants encoding different isoforms. [provided by RefSeq, Jul 2008]

Protein Pathways: Metabolic pathways, One carbon pool by folate, Purine metabolism
