**Summary:** This gene encodes a protein that is conserved across metazoans. In vertebrates, this gene is linked in a head-to-head arrangement with the adjacent parkin gene, which is associated with autosomal recessive juvenile Parkinson's disease. These genes are co-regulated in various tissues and they share a bi-directional promoter. Both genes are associated with susceptibility to leprosy. The parkin co-regulated gene protein forms a large molecular complex with chaperones, including heat shock proteins 70 and 90, and chaperonin components. This protein is also a component of Lewy bodies in Parkinson's disease patients, and it suppresses unfolded Pael receptor-induced neuronal cell death. Multiple transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Jul 2008]

PARK2 E3 ubiquitin ligase ubiquitinates BCL-XL in vitro. Recombinant proteins BCL-XL and PARK2 (OriGene TP322240) were incubated in HEPES buffer, pH 8.0 containing E1, E2, ubiquitin, and Mg<sup>2+</sup>-ATP. Reactions were cultured for 10 min at 30 C, then 30 - 60 min at 37 C, and reaction samples were subjected to Western blot analysis with the indicated antibodies.
