Summary: The protein encoded by this gene is a member of the MAP kinase family. MAP kinases a an integration point for multiple biochemical signals, and are involved in a wide variety cellular processes such as proliferation, differentiation, transcription regulation and development. This kinase is activated by various cell stimuli, and targets specific transcri factors, and thus mediates immediate-early gene expression in response to cell stimuli activation of this kinase by tumor-necrosis factor alpha (TNF-alpha) is found to be required TNF-alpha induced apoptosis. This kinase is also involved in UV radiation induced apopt which is thought to be related to cytochrom c-mediated cell death pathway. Studies of mouse counterpart of this gene suggested that this kinase play a key role in T cell proliferation, apoptosis and differentiation. Several alternatively spliced transcript variate encoding distinct isoforms have been reported. [provided by RefSeq, Apr 2016]
