Summary: This gene encodes a member of the muscleblind protein family which was initially described in

Drosophila melanogaster. The encoded protein is a C3H-type zinc finger protein that modulates alternative splicing of pre-mRNAs. Muscleblind proteins bind specifically to expanded dsCUG RNA but not to normal size CUG repeats and may thereby play a role in the pathophysiology of myotonic dystrophy. Mice lacking this gene exhibited muscle abnormalities and cataracts. Several alternatively spliced transcript variants have been described but the full-length natures of only

some have been determined. The different isoforms are thought to have different binding

specificities and/or splicing activities. [provided by RefSeq, Sep 2015]
