	Sumo 2 (SUMO2) (NM_006937) Human Recombinant Protein – TP324336L
Cytogenetics:	17q25.1
RefSeq ORF:	285
Synonyms:	HSMT3; Smt3A; SMT3B; SMT3H2; SUMO3
Summary:	This gene encodes a protein that is a member of the SUMO (small ubiquitin-like modifier) protein family. It functions in a manner similar to ubiquitin in that it is bound to target proteins as part of a post-translational modification system. However, unlike ubiquitin which targets proteins for degradation, this protein is involved in a variety of cellular processes, such as nuclear transport, transcriptional regulation, apoptosis, and protein stability. It is not active until the last two amino acids of the carboxy-terminus have been cleaved off. Numerous pseudogenes have been reported for this gene. Alternate transcriptional splice variants, encoding different isoforms, have been characterized. [provided by RefSeq, Jul 2008]
