Summary: This gene encodes a nucleic-acid binding protein with seven zinc-finger domains. The protein

has a preference for binding single stranded DNA and RNA. The protein functions in capindependent translation of ornithine decarboxylase mRNA, and may also function in sterolmediated transcriptional regulation. A CCTG expansion from <30 repeats to 75-11000 repeats in the first intron of this gene results in myotonic dystrophy type 2. Multiple transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Jul 2016]
