| Summary:         | The encoded protein, a member of the tumor necrosis factor family, is a cytokine produced by<br>lymphocytes. The protein is highly inducible, secreted, and forms heterotrimers with<br>lymphotoxin-beta which anchor lymphotoxin-alpha to the cell surface. This protein also<br>mediates a large variety of inflammatory, immunostimulatory, and antiviral responses, is<br>involved in the formation of secondary lymphoid organs during development and plays a role<br>in apoptosis. Genetic variations in this gene are associated with susceptibility to leprosy type<br>4, myocardial infarction, non-Hodgkin's lymphoma, and psoriatic arthritis. Alternatively<br>spliced transcript variants have been observed for this gene. [provided by RefSeq, Jul 2012] |
