| Summary:          | This gene encodes a member of the syntaxin superfamily. Syntaxins are nervous system-<br>specific proteins implicated in the docking of synaptic vesicles with the presynaptic plasma<br>membrane. Syntaxins possess a single C-terminal transmembrane domain, a SNARE [Soluble<br>NSF (N-ethylmaleimide-sensitive fusion protein)-Attachment protein REceptor] domain<br>(known as H3), and an N-terminal regulatory domain (Habc). Syntaxins bind synaptotagmin in<br>a calcium-dependent fashion and interact with voltage dependent calcium and potassium<br>channels via the C-terminal H3 domain. This gene product is a key molecule in ion channel<br>regulation and synaptic exocytosis. Alternatively spliced transcript variants encoding different<br>isoforms have been found for this gene.[provided by RefSeq, Sep 2009] |
