Summary: This locus represents naturally occurring read-through transcription from the neighboring IQ

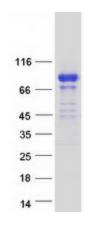

motif containing J (IQCJ) and schwannomin interacting protein 1 (SCHIP1) genes. Alternative splicing results in multiple transcript variants that are composed of in-frame exons from each

individual gene. The resulting fusion products are thought to be components of the

multimolecular complexes of axon initial segments and nodes of Ranvier, and they may play a

role in calcium-mediated responses. [provided by RefSeq, Oct 2010]
