GRIGENE IL6 (NM_000600) Human Recombinant Protein – TP720008XL

Summary:	This gene encodes a cytokine that functions in inflammation and the maturation of B cells. In
	addition, the encoded protein has been shown to be an endogenous pyrogen capable of
	inducing fever in people with autoimmune diseases or infections. The protein is primarily
	produced at sites of acute and chronic inflammation, where it is secreted into the serum and
	induces a transcriptional inflammatory response through interleukin 6 receptor, alpha. The
	functioning of this gene is implicated in a wide variety of inflammation-associated disease
	states, including suspectibility to diabetes mellitus and systemic juvenile rheumatoid arthritis.
	Elevated levels of the encoded protein have been found in virus infections, including COVID-
	19 (disease caused by SARS-CoV-2). [provided by RefSeq, Aug 2020]
