Summary: Kallikreins are a subgroup of serine proteases having diverse physiological functions. Growing

evidence suggests that many kallikreins are implicated in carcinogenesis and some have potential as novel cancer and other disease biomarkers. This gene is one of the fifteen kallikrein subfamily members located in a cluster on chromosome 19. This protein is

functionally conserved in its capacity to release the vasoactive peptide, Lys-bradykinin, from

low molecular weight kiningen. [provided by RefSeq, Jul 2008]
