**Summary:** The protein encoded by this gene is a cytoplasmic enzyme involved in energy homeostasis

and is an important serum marker for myocardial infarction. The encoded protein reversibly catalyzes the transfer of phosphate between ATP and various phosphogens such as creatine phosphate. It acts as a homodimer in striated muscle as well as in other tissues, and as a heterodimer with a similar brain isozyme in heart. The encoded protein is a member of the

ATP:guanido phosphotransferase protein family. [provided by RefSeq, Jul 2008]
