## MTHFS (NM\_006441) Human Recombinant Protein - TP721196M

Summary: The protein encoded by this gene is an enzyme that catalyzes the conversion of 5-

formyltetrahydrofolate to 5,10-methenyltetrahydrofolate, a precursor of reduced folates involved in 1-carbon metabolism. An increased activity of the encoded protein can result in an increased folate turnover rate and folate depletion. Three transcript variants encoding two

different isoforms have been found for this gene. [provided by RefSeq, Jun 2011]

**Protein Pathways:** Metabolic pathways, One carbon pool by folate
