Monkeypox virus A29L Protein, His Tag

Product data:

Product Type: Recombinant Proteins

Description: Monkeypox virus A29L Protein, His Tag

Expression Host: HEK293
Tag: C-6×His

Predicted MW: The protein has a predicted molecular mass of 13.4 kDa after removal of the signal peptide.

The apparent molecular mass of Monkeypox virus A29L-His is approximately 10-25 kDa due

to glycosylation.

Purity: The purity of the protein is greater than 85% as determined by SDS-PAGE and Coomassie

blue staining.

Reconstitution Method: Lyophilized from sterile PBS, pH 7.4. Normally 5 % - 8% trehalose is added as protectants

before lyophilization.

Storage: Store at -20°C to -80°C for 12 months in lyophilized form. After reconstitution, if not intended

for use within a month, aliquot and store at -80°C (Avoid repeated freezing and thawing).

Lyophilized proteins are shipped at ambient temperature.

Stability: 12 months from date of despatch

Summary: Monkeypox is a rare zoonosis caused by monkeypox virus, which has become the most

serious orthpoxvirus and consists of complex double stranded DNA. The cases are mostly in central and western Africa. The pathogenesis of monkeypox is that the virus invades the body from respiratory mucosa, multiplies in lymphocytes, and incurs into blood producing transient venereal toxemia. after the virus multiplies in cells, the cells can invade the blood and propagate to the skin of the whole body, causing lesions. A29L binds to cell surface

heparin to promote fusion of viral membrane with host plasma membrane.
