## **Hepatitis B virus HBSAG Protein, hFc Tag**

**Product data:** 

**Product Type:** Recombinant Proteins

**Description:** Hepatitis B virus HBSAG Protein, hFc Tag

**Expression Host:** HEK293

Tag: C-Human Fc

**Predicted MW:** The protein has a predicted molecular mass of 38.5 kDa after removal of the signal peptide.

The apparent molecular mass of HBSAG-hFc is approximately 35-70 kDa due to glycosylation.

**Purity:** The purity of the protein is greater than 95% as determined by SDS-PAGE and Coomassie

blue staining.

**Reconstitution Method:** Lyophilized from sterile PBS, pH 7.4. Normally 5 % - 8% trehalose is added as protectants

before lyophilization.

Storage: Store at -20°C to -80°C for 12 months in lyophilized form. After reconstitution, if not intended

for use within a month, aliquot and store at -80°C (Avoid repeated freezing and thawing).

Lyophilized proteins are shipped at ambient temperature.

**Stability:** 12 months from date of despatch

**Summary:** Hepatitis B virus (HBV) is a human pathogen, causing serious liver disease. At the center of

the hepatitis B virus is DNA, which contains the genes the virus uses to replicate itself. Surrounding the DNA is a protein called HBcAg (hepatitis B core antigen), which cannot be detected with blood tests. Surrounding this is HBsAg, which is actually part of the protective "envelope." This envelope surrounds the virus and protects it from attack by the body's immune system. HBsAg stands for hepatitis B surface antigen and is the surface antigen of the Hepatitis-B-Virus (HBV) S-gene. The capsid of a virus has different surface proteins from the rest of the virus. The antigen is a protein that binds specifically on one of these surface

proteins. It is commonly referred to as the Australian Antigen.
