	CD3E (NM_000733) Human Recombinant Protein – TP762714
Summary:	The protein encoded by this gene is the CD3-epsilon polypeptide, which together with CD3- gamma, -delta and -zeta, and the T-cell receptor alpha/beta and gamma/delta heterodimers, forms the T-cell receptor-CD3 complex. This complex plays an important role in coupling antigen recognition to several intracellular signal-transduction pathways. The genes encoding the epsilon, gamma and delta polypeptides are located in the same cluster on chromosome 11. The epsilon polypeptide plays an essential role in T-cell development. Defects in this gene cause immunodeficiency. This gene has also been linked to a susceptibility to type I diabetes in women. [provided by RefSeq, Jul 2008]
Protein Families:	Druggable Genome, Transmembrane
Protein Pathway	s: Hematopoietic cell lineage, Primary immunodeficiency, T cell receptor signaling pathway
