| Summary:                     | Bystin is expressed as a 2-kb major transcript and a 3.6-kb minor transcript in SNG-M cells<br>and in human trophoblastic teratocarcinoma HT-H cells. Protein binding assays determined<br>that bystin binds directly to trophinin and tastin, and that binding is enhanced when<br>cytokeratins 8 and 18 are present. Immunocytochemistry of HT-H cells showed that bystin<br>colocalizes with trophinin, tastin, and the cytokeratins, suggesting that these molecules form<br>a complex in trophectoderm cells at the time of implantation. Using immunohistochemistry it<br>was determined that trophinin and bystin are found in the placenta from the sixth week of<br>pregnancy. Both proteins were localized in the cytoplasm of the syncytiotrophoblast in the<br>chorionic villi and in endometrial decidual cells at the uteroplacental interface. After week 10,<br>the levels of trophinin, tastin, and bystin decreased and then disappeared from placental villi.<br>[provided by RefSeq, Jul 2008] |
| shRNA Design:                | These shRNA constructs were designed against multiple splice variants at this gene locus. To be certain that your variant of interest is targeted, please contact <u>techsupport@origene.com</u> .<br>If you need a special design or shRNA sequence, please utilize our <u>custom shRNA service</u> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### **GRIGENE** BYSL Human shRNA Plasmid Kit (Locus ID 705) – TR315536

Performance Guaranteed: OriGene guarantees that the sequences in the shRNA expression cassettes are verified to correspond to the target gene with 100% identity. One of the four constructs at minimum are guaranteed to produce 70% or more gene expression knock-down provided a minimum transfection efficiency of 80% is achieved. Western Blot data is recommended over qPCR to evaluate the silencing effect of the shRNA constructs 72 hrs post transfection. To properly assess knockdown, the gene expression level from the included scramble control vector must be used in comparison with the target-specific shRNA transfected samples.

For non-conforming shRNA, requests for replacement product must be made within ninety (90) days from the date of delivery of the shRNA kit. To arrange for a free replacement with newly designed constructs, please contact Technical Services at techsupport@origene.com. Please provide your data indicating the transfection efficiency and measurement of gene expression knockdown compared to the scrambled shRNA control (Western Blot data preferred).
