Background:	The protein encoded by this gene forms a complex with ERCC1 and is involved in the 5' incision made during nucleotide excision repair. This complex is a structure specific DNA repair endonuclease that interacts with EME1. Defects in this gene are a cause of xeroderma pigmentosum complementation group F (XP-F), or xeroderma pigmentosum VI (XP6).
Synonyms:	ERCC11; FANCC; RAD1; XFEPS; XPF

OriGene overexpression protein microarray chip was immunostained with UltraMAB anti-XPF mouse monoclonal antibody (clone UMAB21). The positive reactive proteins are highlighted with two red arrows in the enlarged subarray. All the positive controls spotted in this subarray are also labeled for clarification. These data show that UltraMAB anti-XPF (UMAB21) very specifically recognizes XPF antigen on OriGene protein microarray chip.
