**Background:** The proto-oncogene MET product is the hepatocyte growth factor receptor and encodes

tyrosine-kinase activity. The primary single chain precursor protein is post-translationally cleaved to produce the alpha and beta subunits, which are disulfide linked to form the mature receptor. Various mutations in the MET gene are associated with papillary renal carcinoma. Two transcript variants encoding different isoforms have been found for this

gene. (provided by RefSeq, Jul 2008)

**Synonyms:** AUTS9; c-Met; DFNB97; HGFR; RCCP2

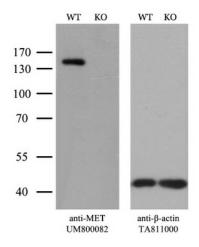

**Protein Families:** Druggable Genome, Protein Kinase, Transmembrane

**Protein Pathways:** Adherens junction, Axon guidance, Colorectal cancer, Cytokine-cytokine receptor interaction,

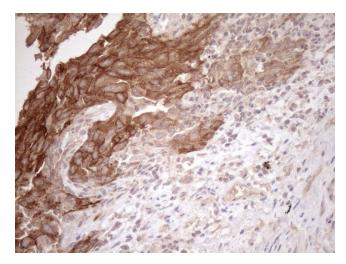

Endocytosis, Epithelial cell signaling in Helicobacter pylori infection, Focal adhesion,

Melanoma, Pathways in cancer, Renal cell carcinoma

## **Product images:**

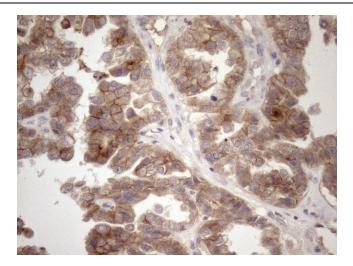

Equivalent amounts of cell lysates (10 ug per lane) of wild-type HeLa cells (WT, Cat# LC810HELA) and MET-Knockout hela cells (KO, Cat# [LC810144]) were separated by SDS-PAGE and immunoblotted with anti-MET monoclonal antibody UM800082. Then the blotted membrane was stripped and reprobed with anti-β-actin ([TA811000]) as a loading control (1:500).
